AMENDMENTS TO THE CLAIMS

1. (Currently Amended) A method for treatment of untreated injection water (26) for a subsea injection well, in which the injection water (26) may be water from a body of water overlying the well and/or produced water from a well production stream, the method employing an apparatus (10) and a connected water injection pumping equipment that is lowered into said body of water and is connected to the injection well for use under water, and in which water treatment equipment in the apparatus (10) is assembled within at least one module (20), the at least one module (20) containing at least one receptacle (38, 40, 46, 48, 50) and an associated network of lines (34, 44) provided with associated valves (36, 36') through which the water (26) may flow during the water injection, said method comprising ~~characterized in that the method also comprises the following steps:~~

- providing the at least one receptacle (38, 40, 46, 48, 50) with at least one type of water-soluble solid-state chemical;
- bringing the water (26) into contact with the at least one solid-state chemical, causing it to gradually dissolve and mix with the water (26); and
- leading treated water (26') into an injection stream to the injection well and into an associated reservoir.

2. (Currently Amended) The method according to claim 1, ~~characterized in~~ comprising providing the at least one receptacle (38, 40, 46, 48, 50) with at least one solid-state unit of the at least one chemical.

3. The method according to claim 2, ~~characterized in~~ comprising providing the at least one receptacle (38, 40, 46, 48, 50) with at least one solid-state chemical unit having at least one of the following forms: block, tablet, pill, granule and pellet (42, 52, 54, 56).

4. The method according to claim 1, 2 or 3, ~~characterized in~~ comprising providing the at least one receptacle (38, 40, 46, 48, 50) with at least one of the following types of solid-state chemicals:

- Chlorine;

Appl. No. :
Filed :

- poly-electrolytes;
- iron chloride;
- oxygen scavenger;
- corrosion inhibitor;
- scale inhibitor; or
- biocide.

5. The method according to claim 1, ~~characterized in~~ comprising arranging one or more receptacles ~~(38, 40, 46, 48, 50)~~ as replaceable receptacles ~~(38, 40, 46, 48, 50)~~.

6. The method according to claim 5, ~~characterized in~~ comprising arranging one or more receptacles ~~(38, 40, 46, 48, 50)~~ as replaceable cassettes, cartridges or inserts.

7. The method according to claim 1, ~~characterized in~~ comprising arranging one or more receptacles ~~(46, 48, 50)~~ for continuous flow of the water ~~(26)~~ across and past the at least one chemical therein.

8. The method according to claim 1, ~~characterized in~~ comprising arranging one or more receptacles ~~(38, 40)~~ for periodical shock-dosing of the at least one chemical therein.

9. The method according to claim 1, ~~characterized in~~ comprising also connecting the apparatus ~~(10)~~, via said network of lines ~~(34, 44)~~ and associated valves ~~(36, 36')~~, to at least one UV-sterilization receptacle ~~(58, 60)~~ in which at least one UV-lamp ~~(62)~~ is placed for bactericidal action in water ~~(26)~~ flowing therethrough.

10. The method according to claim 1 or 9, ~~characterized in~~ comprising also connecting the apparatus ~~(10)~~, via said network of lines ~~(34, 44)~~ and associated valves ~~(36, 36')~~, to at least one electro-chlorination receptacle ~~(64)~~ in which a high-voltage cell ~~(66)~~ is placed for inhibiting organism growth in water ~~(26)~~ flowing therethrough, inasmuch as electro-chlorination may be carried out with or without copper-ion dosing.

Appl. No. :
Filed :

11. The method according to claim 1, ~~characterized in~~ comprising arranging the apparatus (10) removably on a foundation (16) on a water bed (12) in proximity of the subsea well.

12. An apparatus (10) for treatment of untreated injection water (26) for a subsea injection well, in which the injection water (26) may be water from a body of water overlying the well and/or produced water from a well production stream, the apparatus (10) and a water injection pumping equipment connected thereto being disposed, in their position of use, under water in said body of water and in connection with the injection well, and in which water treatment equipment in the apparatus (10) is assembled within at least one module (20), the at least one module (20) containing at least one receptacle (38, 40, 46, 48, 50) and an associated network of lines (34, 44) provided with associated valves (36, 36') through which the water (26) may flow during the water injection, wherein ~~characterized in that~~ the at least one receptacle (38, 40, 46, 48, 50) contains at least one type of water-soluble solid-state chemical for treatment of the water (26), the at least one chemical dissolving gradually upon contact with the water (26) and mixing with the water (26), after which treated water (26') may be pumped into the injection well and into an associated reservoir.

13. The apparatus (10) according to claim 12, wherein ~~characterized in that~~ the at least one chemical exists as at least one solid-state unit.

14. The apparatus (10) according to claim 13, wherein ~~characterized in that~~ the at least one solid-state chemical exists in at least one of the following forms: block, tablet, pill, granule and pellet (42, 52, 54, 56).

15. The apparatus (10) according to claim 12, 13 or 14, wherein ~~characterized in that~~ the solid-state chemical is at least one of the following types of chemicals:

- Chlorine;
- poly-electrolytes;

Appl. No. :
Filed :

- iron chloride;
- oxygen scavenger;
- corrosion inhibitor;
- scale inhibitor; or
- biocide.

16. The apparatus (10) according to claim 12, wherein ~~characterized in that~~ one or more receptacles (38, 40, 46, 48, 50) are replaceable.

17. The apparatus (10) according to claim 16, wherein ~~characterized in that~~ one or more receptacles (38, 40, 46, 48, 50) are replaceable cassettes, cartridges or inserts.

18. The apparatus (10) according to claim 12, wherein ~~characterized in that~~ one or more receptacles (46, 48, 50) are arranged for continuous flow of the water (26) across and past the at least one chemical therein.

19. The apparatus (10) according to claim 12, wherein ~~characterized in that~~ one or more receptacles (38, 40) are arranged for periodical shock-dosing of the at least one chemical therein.

20. The apparatus (10) according to claim 12, wherein ~~characterized in that~~ the apparatus (10) also is connected, via said network of lines (34, 44) and associated valves (36, 36'), to at least one UV-sterilization receptacle (58, 60) in which at least one UV-lamp (62) is placed for bactericidal action in water (26) flowing therethrough.

21. The apparatus (10) according to claim 12 or 20, wherein ~~characterized in that~~ the apparatus (10) also is connected, via said network of lines (34, 44) and associated valves (36, 36'), to at least one electro-chlorination receptacle (64) in which a high-voltage cell (66) is placed for inhibiting organism growth in water (26) flowing therethrough, inasmuch as electro-chlorination may be carried out with or without copper-ion dosing.

Appl. No. :
